

ROS理论与实践

—— 第3讲：ROS通信编程

主讲人 胡春旭

机器人博客“古月居”博主
《ROS机器人开发实践》作者
武汉精锋微控科技有限公司 联合创始人
华中科技大学 自动化学院 硕士

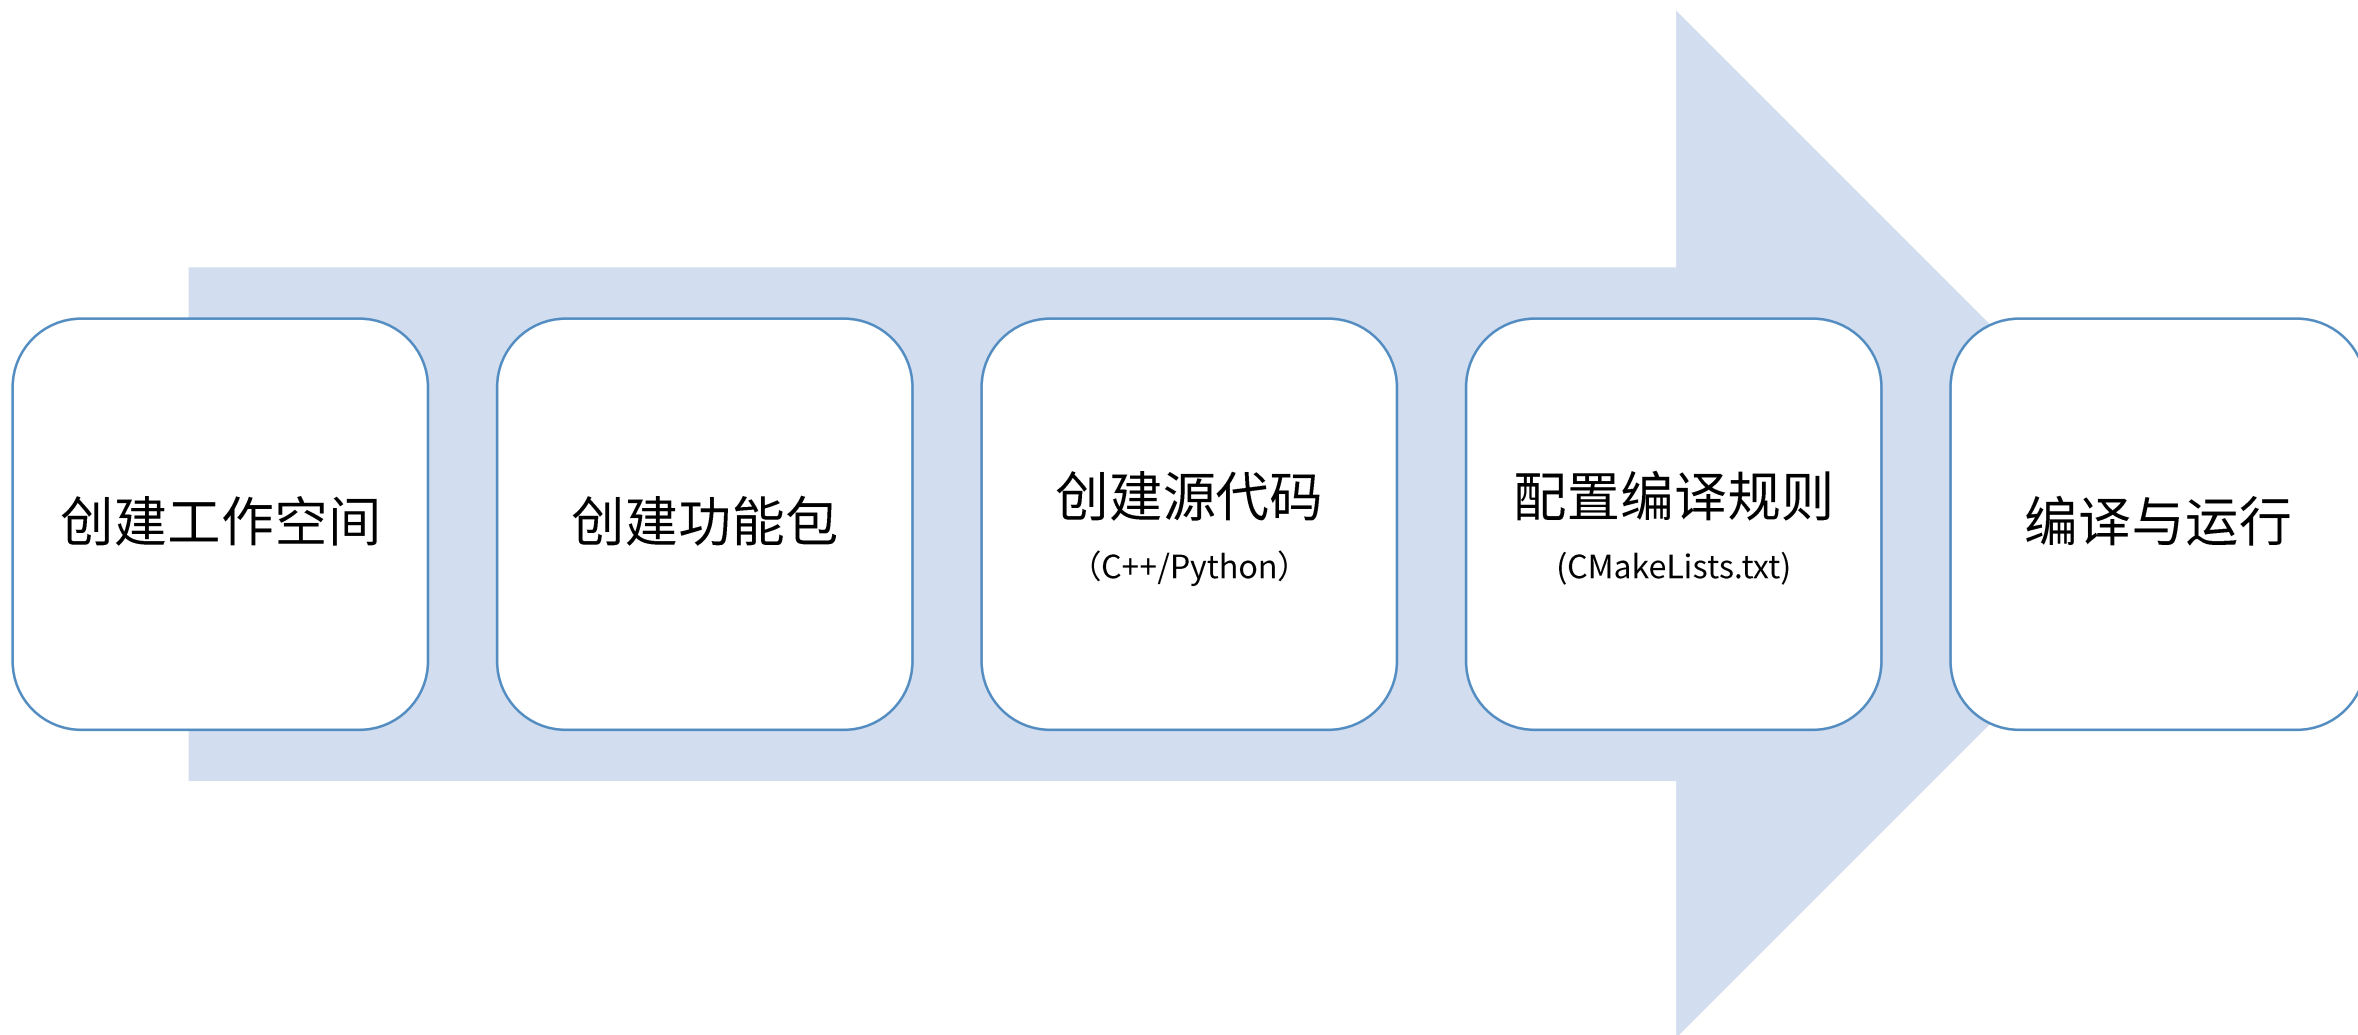

-  1. ROS项目开发流程
-  2. ROS Topic通信编程
-  3. ROS Service通信编程

1. ROS项目开发流程

1. ROS项目开发流程

1. ROS项目开发流程

工作空间（workspace）是一个存放工程开发相关文件的文件夹。

- **src**: 代码空间（Source Space）
- **build**: 编译空间（Build Space）
- **devel**: 开发空间（Development Space）
- **install**: 安装空间（Install Space）

```
workspace_folder/      -- WORKSPACE
src/                   -- SOURCE SPACE
  CMakeLists.txt        -- The 'toplevel' CMake file
  package_1/
    CMakeLists.txt
    package.xml
    ...
  package_n/
    CMakeLists.txt
    package.xml
    ...
build/                 -- BUILD SPACE
  CATKIN_IGNORE         -- Keeps catkin from walking this directory
devel/                 -- DEVELOPMENT SPACE (set by CATKIN_DEVEL_PREFIX)
  bin/
  etc/
  include/
  lib/
  share/
  .catkin
  env.bash
  setup.bash
  setup.sh
  ...
install/               -- INSTALL SPACE (set by CMAKE_INSTALL_PREFIX)
  bin/
  etc/
  include/
  lib/
  share/
  .catkin
  env.bash
  setup.bash
  setup.sh
  ...
```

catkin编译系统下的工作空间结构

1. ROS项目开发流程

创建工作空间

```
$ mkdir -p ~/catkin_ws/src  
$ cd ~/catkin_ws/src  
$ catkin_init_workspace
```

编译工作空间

```
$ cd ~/catkin_ws/  
$ catkin_make
```

设置环境变量

```
$ source devel/setup.bash
```

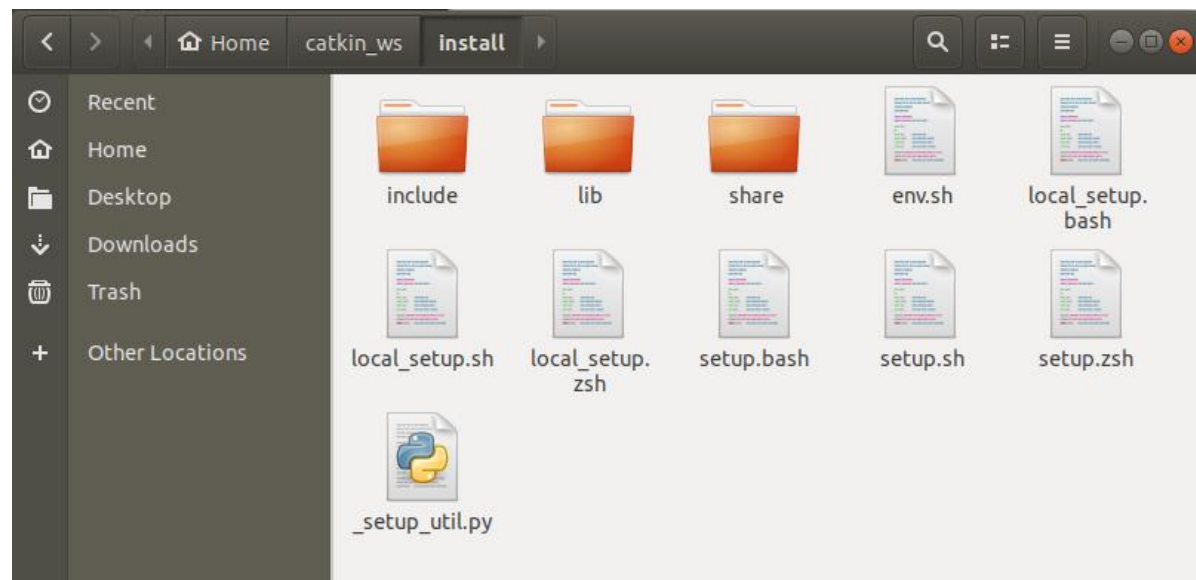

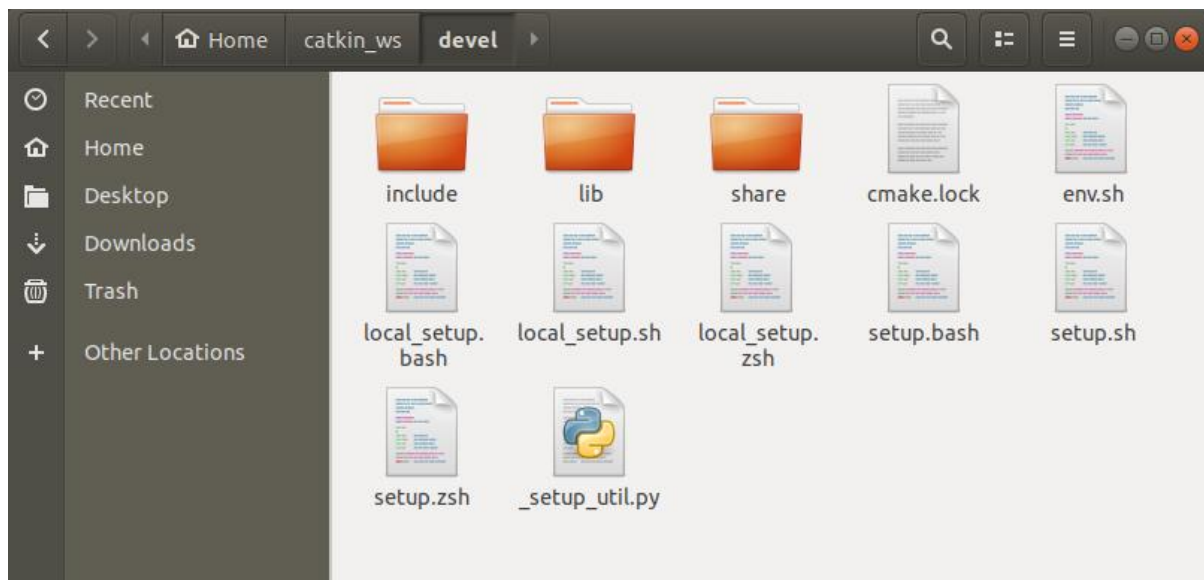

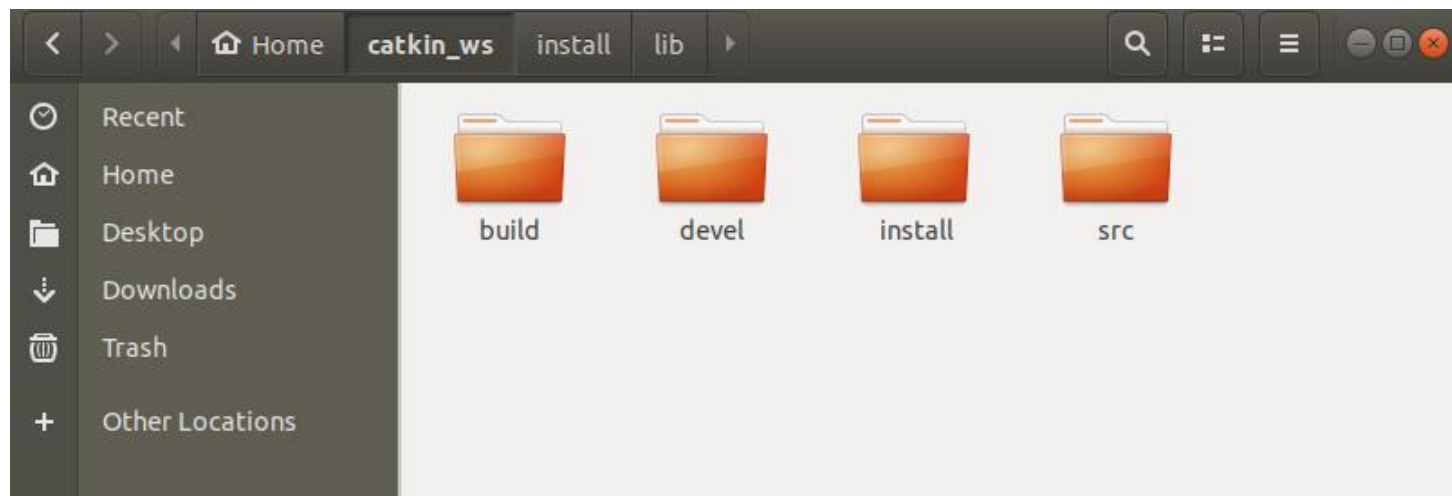

检查环境变量

```
$ echo $ROS_PACKAGE_PATH
```

```
hcx@hcx-vpc:~$ echo $ROS_PACKAGE_PATH  
/home/hcx/catkin_ws/src:/opt/ros/melodic/share
```

1. ROS项目开发流程

1. ROS项目开发流程

\$ catkin_create_pkg <package_name> [depend1] [depend2] [depend3]

创建功能包

```
$ cd ~/catkin_ws/src  
$ catkin_create_pkg learning_communication rospy roscpp std_msgs std_srvs
```

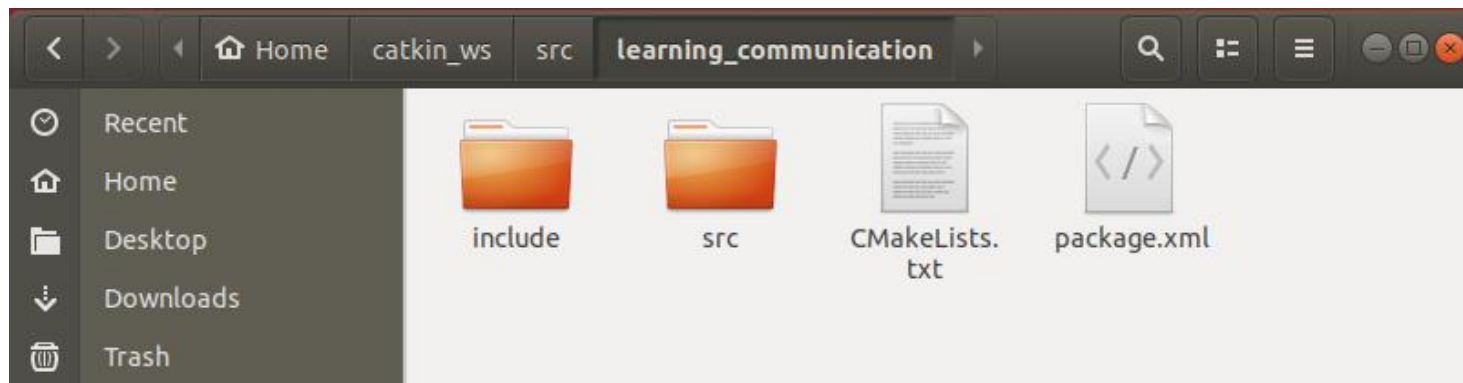

编译功能包

```
$ cd ~/catkin_ws  
$ catkin_make  
$ source ~/catkin_ws/devel/setup.bash
```

同一个工作空间下，不允许存在同名功能包
不同工作空间下，允许存在同名功能包

1. ROS项目开发流程

```
Open package.xml Save
~/catkin_ws/src/learning_communication

1 <?xml version="1.0"?>
2 <package format="2">
3   <name>learning_communication</name>
4   <version>0.0.0</version>
5   <description>The learning_communication package</description>

```

2. ROS Topic通信编程

2. ROS Topic通信编程

话题模型（发布/订阅）

2. ROS Topic通信编程

```
/**
 * 该例程将发布chatter话题，消息类型String
 */

#include <sstream>
#include "ros/ros.h"
#include "std_msgs/String.h"

int main(int argc, char **argv)
{
    // ROS节点初始化
    ros::init(argc, argv, "string_publisher");

    // 创建节点句柄
    ros::NodeHandle n;

    // 创建一个Publisher，发布名为chatter的topic，消息类型为std_msgs::String
    ros::Publisher chatter_pub = n.advertise<std_msgs::String>("chatter", 1000);

    // 设置循环的频率
    ros::Rate loop_rate(10);

    int count = 0;
    while (ros::ok())
    {
        // 初始化std_msgs::String类型的消息
        std_msgs::String msg;
        std::stringstream ss;
        ss << "hello world " << count;
        msg.data = ss.str();

        // 发布消息
        ROS_INFO("%s", msg.data.c_str());
        chatter_pub.publish(msg);

        // 按照循环频率延时
        loop_rate.sleep();
        ++count;
    }

    return 0;
}
```

string_publisher.cpp

如何实现一个发布者

- 初始化ROS节点；
- 向ROS Master注册节点信息，包括发布的话题名和话题中的消息类型；
- 创建消息数据；
- 按照一定频率循环发布消息。

2. ROS Topic通信编程

```
/**
 * 该例程将订阅chatter话题，消息类型String
 */

#include "ros/ros.h"
#include "std_msgs/String.h"

// 接收到订阅的消息后，会进入消息回调函数
void chatterCallback(const std_msgs::String::ConstPtr& msg)
{
    // 将接收到的消息打印出来
    ROS_INFO("I heard: [%s]", msg->data.c_str());
}

int main(int argc, char **argv)
{
    // 初始化ROS节点
    ros::init(argc, argv, "string_subscriber");

    // 创建节点句柄
    ros::NodeHandle n;

    // 创建一个Subscriber，订阅名为chatter的topic，注册回调函数chatterCallback
    ros::Subscriber sub = n.subscribe("chatter", 1000, chatterCallback);

    // 循环等待回调函数
    ros::spin();

    return 0;
}
```

string_subscriber.cpp

如何实现一个订阅者

- 初始化ROS节点；
- 订阅需要的话题；
- 循环等待话题消息，接收到消息后进入回调函数；
- 在回调函数中完成消息处理。

2. ROS Topic通信编程

```
## Declare a C++ executable
## With catkin_make all packages are built within a single CMake context
## The recommended prefix ensures that target names across packages don't collide
# add_executable(${PROJECT_NAME}_node src/learning_communication_node.cpp)

## Specify libraries to link a library or executable target against
# target_link_libraries(${PROJECT_NAME}_node
#   ${catkin_LIBRARIES}
# )

add_executable(string_publisher src/string_publisher.cpp)
target_link_libraries(string_publisher ${catkin_LIBRARIES})

add_executable(string_subscriber src/string_subscriber.cpp)
target_link_libraries(string_subscriber ${catkin_LIBRARIES})
```

如何配置CMakeLists.txt中的编译规则

- 设置需要编译的代码和生成的可执行文件；
- 设置链接库；

```
add_executable(string_publisher src/string_publisher.cpp)
target_link_libraries(string_publisher ${catkin_LIBRARIES})
```

```
add_executable(string_subscriber src/string_subscriber.cpp)
target_link_libraries(string_subscriber ${catkin_LIBRARIES})
```

2. ROS Topic通信编程

```
$ cd ~/catkin_ws
```

```
$ catkin_make
```

```
$ source devel/setup.bash
```

```
$ roscore
```

```
$ rosrun learning_communication string_publisher
```

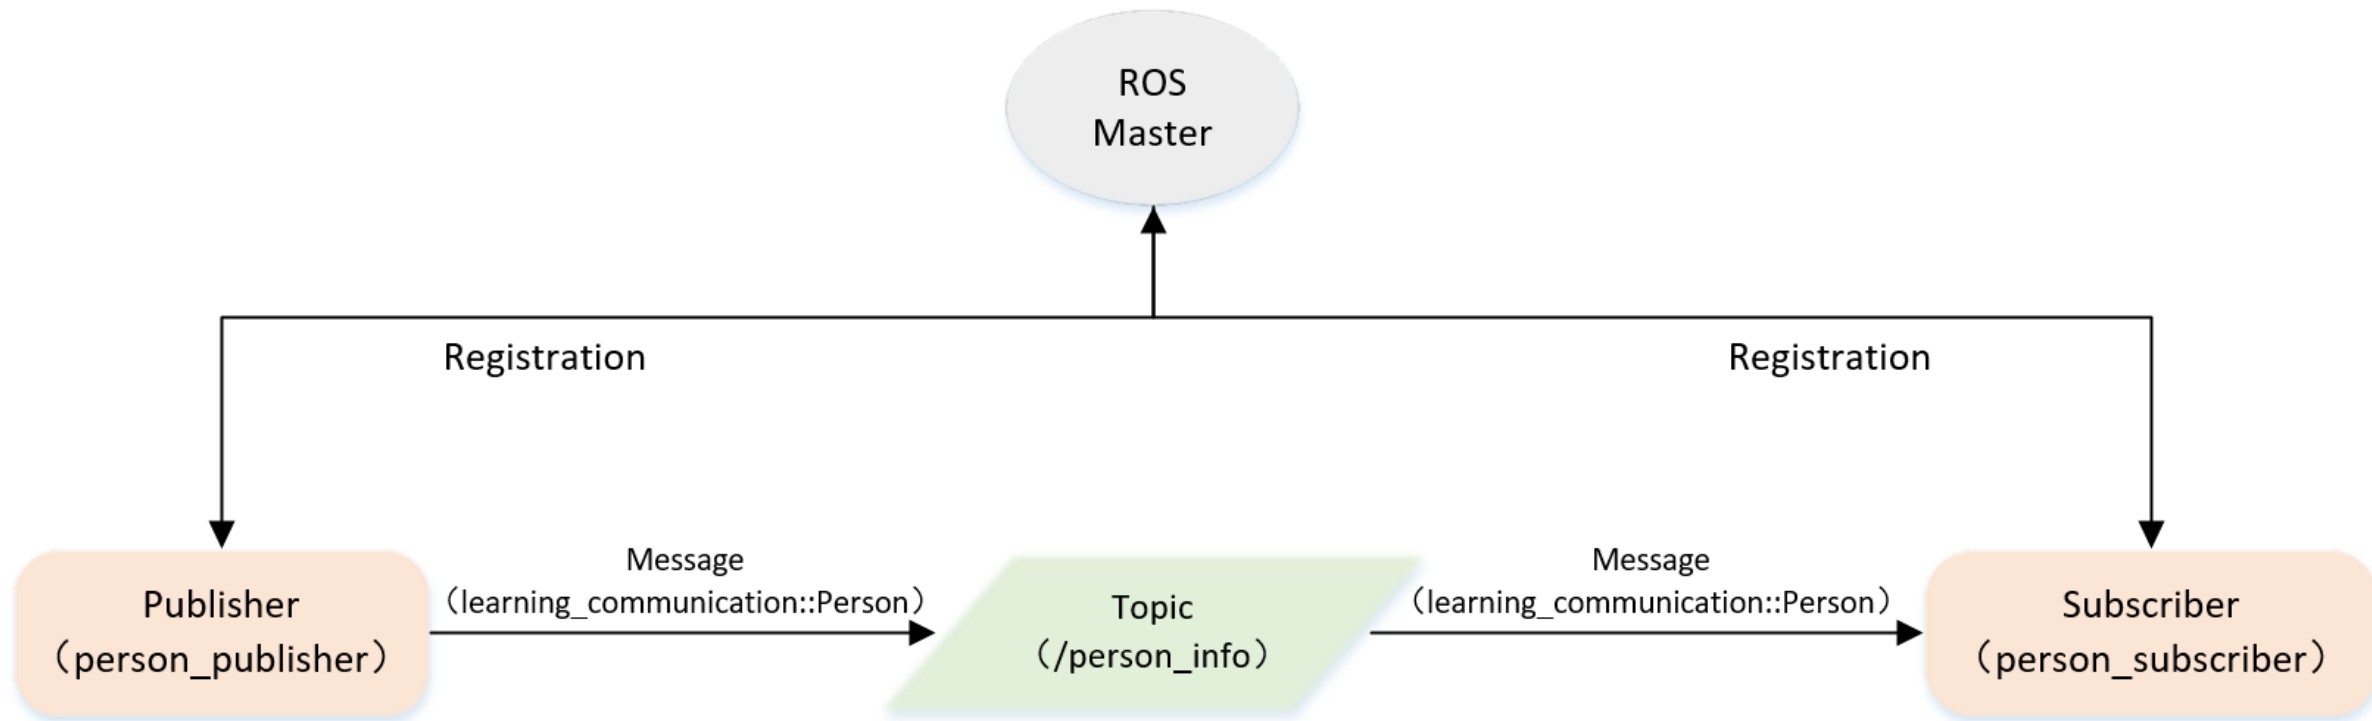

```
$ rosrun learning_communication string_subscriber
```

```

```

2. ROS Topic通信编程

话题模型（发布/订阅）

2. ROS Topic通信编程

如何自定义话题消息

```
string name
```

```
uint8 sex
```

```
uint8 age
```

```
uint8 unknown = 0
```

```
uint8 male = 1
```

```
uint8 female = 2
```

PersonMsg.msg

➤ 定义msg文件；

➤ 在package.xml中添加功能包依赖

```
<build_depend>message_generation</build_depend>  
<exec_depend>message_runtime</exec_depend>
```

➤ 在CMakeLists.txt添加编译选项

- find_package(..... message_generation)
- add_message_files(FILES PersonMsg.msg)
generate_messages(DEPENDENCIES std_msgs)
- catkin_package(..... message_runtime)

➤ 编译生成语言相关文件

2. ROS Topic通信编程

```
/**
 * 该例程将发布/person_info话题, learning_communication::PersonMsg
 */

#include <ros/ros.h>
#include "learning_communication/PersonMsg.h"

int main(int argc, char **argv)
{
    // ROS节点初始化
    ros::init(argc, argv, "person_publisher");

    // 创建节点句柄
    ros::NodeHandle n;

    // 创建一个Publisher, 发布名为/person_info的topic, 消息类型为learning_communication::PersonMsg, 队列长度10
    ros::Publisher person_info_pub = n.advertise<learning_communication::PersonMsg>("/person_info", 10);

    // 设置循环的频率
    ros::Rate loop_rate(1);

    int count = 0;
    while (ros::ok())
    {
        // 初始化learning_communication::Person类型的消息
        learning_communication::PersonMsg person_msg;
        person_msg.name = "Tom";
        person_msg.age = 18;
        person_msg.sex = learning_communication::PersonMsg::male;

        // 发布消息
        person_info_pub.publish(person_msg);

        ROS_INFO("Publish Person Info: name:%s age:%d sex:%d",
                 person_msg.name.c_str(), person_msg.age, person_msg.sex);

        // 按照循环频率延时
        loop_rate.sleep();
    }

    return 0;
}
```

person_publisher.cpp

如何实现一个发布者

- 初始化ROS节点;
- 向ROS Master注册节点信息, 包括发布的话题名和话题中的消息类型;
- 创建消息数据;
- 按照一定频率循环发布消息。

2. ROS Topic通信编程

```
/**
 * 该例程将订阅/person_info话题，自定义消息类型learning_communication::PersonMsg
 */

#include <ros/ros.h>
#include "learning_communication/PersonMsg.h"

// 接收到订阅的消息后，会进入消息回调函数
void personInfoCallback(const learning_communication::PersonMsg::ConstPtr& msg)
{
    // 将接收到的消息打印出来
    ROS_INFO("Subscribe Person Info: name:%s age:%d sex:%d",
             msg->name.c_str(), msg->age, msg->sex);
}

int main(int argc, char **argv)
{
    // 初始化ROS节点
    ros::init(argc, argv, "person_subscriber");

    // 创建节点句柄
    ros::NodeHandle n;

    // 创建一个Subscriber，订阅名为/person_info的topic，注册回调函数personInfoCallback
    ros::Subscriber person_info_sub = n.subscribe("/person_info", 10, personInfoCallback);

    // 循环等待回调函数
    ros::spin();

    return 0;
}
```

person_subscriber.cpp

如何实现一个订阅者

- 初始化ROS节点；
- 订阅需要的话题；
- 循环等待话题消息，接收到消息后进入回调函数；
- 在回调函数中完成消息处理。

2. ROS Topic通信编程

```
## Declare a C++ executable
## With catkin_make all packages are built within a single CMake context
## The recommended prefix ensures that target names across packages don't collide
# add_executable(${PROJECT_NAME}_node src/learning_communication_node.cpp)

## Specify libraries to link a library or executable target against
# target_link_libraries(${PROJECT_NAME}_node
#   ${catkin_LIBRARIES}
# )

## Add cmake target dependencies of the executable
## same as for the library above
# add_dependencies(${PROJECT_NAME}_node ${${PROJECT_NAME}_EXPORTED_TARGETS} ${catkin_EXPORTED_TARGETS})

add_executable(person_publisher src/person_publisher.cpp)
target_link_libraries(person_publisher ${catkin_LIBRARIES})
add_dependencies(person_publisher ${PROJECT_NAME}_gencpp)

add_executable(person_subscriber src/person_subscriber.cpp)
target_link_libraries(person_subscriber ${catkin_LIBRARIES})
add_dependencies(person_subscriber ${PROJECT_NAME}_gencpp)
```

```
add_executable(person_publisher src/person_publisher.cpp)
target_link_libraries(person_publisher ${catkin_LIBRARIES})
add_dependencies(person_publisher ${PROJECT_NAME}_gencpp)

add_executable(person_subscriber src/person_subscriber.cpp)
target_link_libraries(person_subscriber ${catkin_LIBRARIES})
add_dependencies(person_subscriber ${PROJECT_NAME}_gencpp)
```

CMakeLists.txt

如何配置CMakeLists.txt中的编译规则

- 设置需要编译的代码和生成的可执行文件；
- 设置链接库；
- 添加依赖项。

2. ROS Topic通信编程

```
$ cd ~/catkin_ws
```

```
$ catkin_make
```

```
$ source devel/setup.bash
```

```
$ roscore
```

```
$ rosrun learning_communication person_subscriber
```

```
$ rosrun learning_communication person_publisher
```

```
hcx@hcx-vpc:~/catkin_ws$ rosrun learning_topic person_subscriber

[ INFO] [1562216319.856089664]: Publish Person Info: name:Tom age:18 sex:1
[ INFO] [1562216320.855924037]: Publish Person Info: name:Tom age:18 sex:1
```

3. ROS Service通信编程

3. ROS Service通信编程

服务模型（服务端/客户端）

3. ROS Service通信编程

```
/**
 * 该例程将提供print_string服务, std_srvs::SetBool
 */

#include "ros/ros.h"
#include "std_srvs/SetBool.h"

// service回调函数, 输入参数req, 输出参数res
bool print(std_srvs::SetBool::Request &req,
           std_srvs::SetBool::Response &res)
{
    // 打印字符串
    if(req.data)
    {
        ROS_INFO("Hello ROS!");
        res.success = true;
        res.message = "Print Successfully";
    }
    else
    {
        res.success = false;
        res.message = "Print Failed";
    }
}

return true;
}

int main(int argc, char **argv)
{
    // ROS节点初始化
    ros::init(argc, argv, "string_server");

    // 创建节点句柄
    ros::NodeHandle n;

    // 创建一个名为print_string的server, 注册回调函数print()
    ros::ServiceServer service = n.advertiseService("print_string", print);

    // 循环等待回调函数
    ROS_INFO("Ready to print hello string.");
    ros::spin();

    return 0;
}
```

string_server.cpp

如何实现一个服务器

- 初始化ROS节点;
- 创建Server实例;
- 循环等待服务请求, 进入回调函数;
- 在回调函数中完成服务功能的处理, 并反馈应答数据。

3. ROS Service通信编程

```
/**
 * 该例程将请求print_string服务, std_srvs::SetBool
 */

#include "ros/ros.h"
#include "std_srvs/SetBool.h"

int main(int argc, char **argv)
{
    // ROS节点初始化
    ros::init(argc, argv, "string_client");

    // 创建节点句柄
    ros::NodeHandle n;

    // 创建一个client, service消息类型是std_srvs::SetBool
    ros::ServiceClient client = n.serviceClient<std_srvs::SetBool>("print_string");

    // 创建std_srvs::SetBool类型的service消息
    std_srvs::SetBool srv;
    srv.request.data = true;

    // 发布service请求, 等待应答结果
    if (client.call(srv))
    {
        ROS_INFO("Response : [%s] %s", srv.response.success?"True":"False",
                  srv.response.message.c_str());
    }
    else
    {
        ROS_ERROR("Failed to call service print_string");
        return 1;
    }

    return 0;
}
```

string_client.cpp

如何实现一个客户端

- 初始化ROS节点;
- 创建一个Client实例;
- 发布服务请求数据;
- 等待Server处理之后的应答结果。

3. ROS Service通信编程

```
## Declare a C++ executable
## With catkin_make all packages are built within a single CMake context
## The recommended prefix ensures that target names across packages don't collide
# add_executable(${PROJECT_NAME}_node src/learning_communication_node.cpp)

## Specify libraries to link a library or executable target against
# target_link_libraries(${PROJECT_NAME}_node
#   ${catkin_LIBRARIES}
# )

add_executable(string_server src/string_server.cpp)
target_link_libraries(string_server ${catkin_LIBRARIES})

add_executable(string_client src/string_client.cpp)
target_link_libraries(string_client ${catkin_LIBRARIES})
```

如何配置CMakeLists.txt中的编译规则

- 设置需要编译的代码和生成的可执行文件；
- 设置链接库；

```
add_executable(string_server src/string_server.cpp)
target_link_libraries(string_server ${catkin_LIBRARIES})

add_executable(string_client src/string_client.cpp)
target_link_libraries(string_client ${catkin_LIBRARIES})
```

CMakeLists.txt

3. ROS Service通信编程

```
$ cd ~/catkin_ws
```

```
$ catkin_make
```

```
$ source devel/setup.bash
```

```
$ roscore
```

```
$ rosrun learning_communication string_server
```

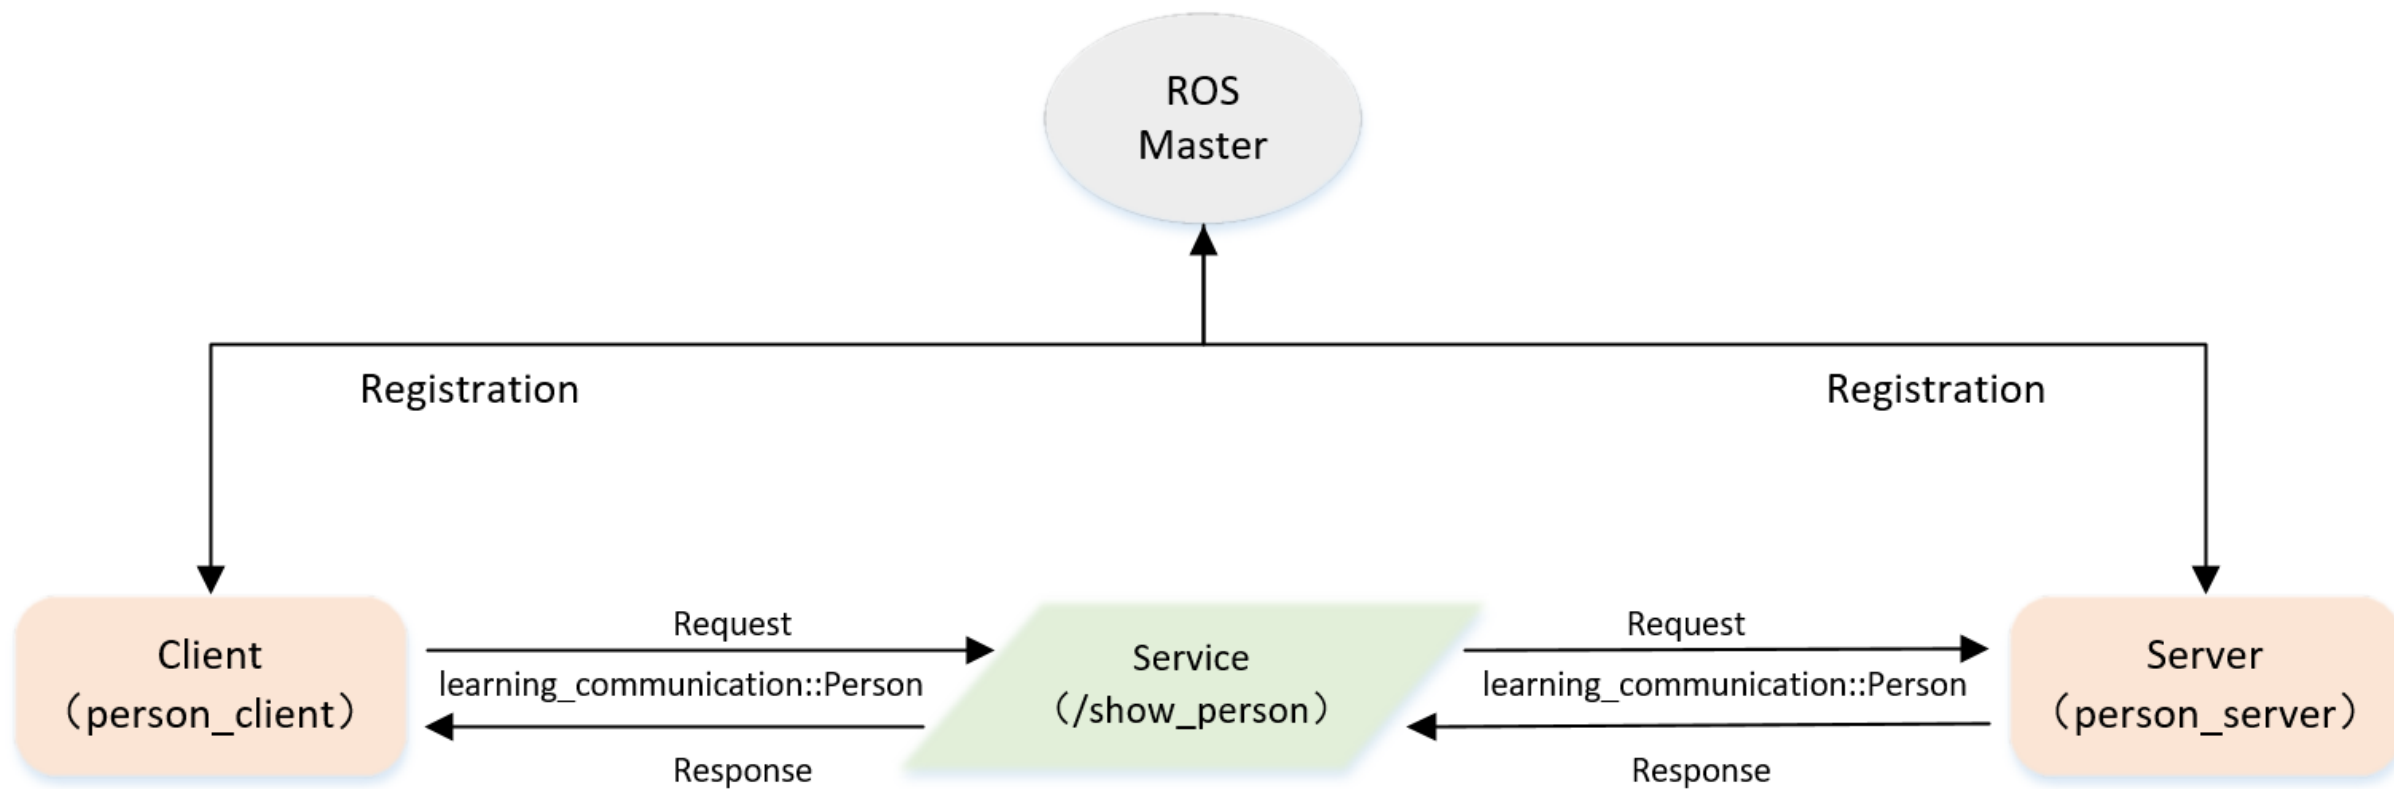

```
$ rosrun learning_communication string_client
```

```
rosrun learning_communication person_server

3. ROS Service通信编程

服务模型（服务端/客户端）

3. ROS Service通信编程

如何自定义服务数据

```
string name
uint8 age
uint8 sex
```

```
uint8 unknown = 0
uint8 male   = 1
uint8 female = 2
---
string result
```

PersonSrv.srv

- 定义srv文件;
- 在package.xml中添加功能包依赖

```
<build_depend>message_generation</build_depend>
<exec_depend>message_runtime</exec_depend>
```
- 在CMakeLists.txt添加编译选项
 - find_package(..... message_generation)
 - add_service_files(FILES PersonSrv.srv)
 generate_messages(DEPENDENCIES std_msgs)
 - catkin_package(..... message_runtime)
- 编译生成语言相关文件

3. ROS Service通信编程

```
/**
 * 该例程将执行/show_person服务，服务数据类型learning_communication::PersonSrv
 */

#include <ros/ros.h>
#include "learning_communication/PersonSrv.h"

// service回调函数，输入参数req，输出参数res
bool personCallback(learning_communication::PersonSrv::Request &req,
                    learning_communication::PersonSrv::Response &res)
{
    // 显示请求数据
    ROS_INFO("Person: name:%s age:%d sex:%d", req.name.c_str(), req.age, req.sex);

    // 设置反馈数据
    res.result = "OK";

    return true;
}

int main(int argc, char **argv)
{
    // ROS节点初始化
    ros::init(argc, argv, "person_server");

    // 创建节点句柄
    ros::NodeHandle n;

    // 创建一个名为/show_person的server，注册回调函数personCallback
    ros::ServiceServer person_service = n.advertiseService("/show_person", personCallback);

    // 循环等待回调函数
    ROS_INFO("Ready to show person informtion.");
    ros::spin();

    return 0;
}
```

person_server.cpp

如何实现一个服务器

- 初始化ROS节点；
- 创建Server实例；
- 循环等待服务请求，进入回调函数；
- 在回调函数中完成服务功能的处理，并反馈应答数据。

3. ROS Service通信编程

```
/**
 * 该例程将请求/show_person服务，服务数据类型learning_communication::PersonSrv
 */

#include <ros/ros.h>
#include "learning_communication/PersonSrv.h"

int main(int argc, char** argv)
{
    // 初始化ROS节点
    ros::init(argc, argv, "person_client");

    // 创建节点句柄
    ros::NodeHandle node;

    // 发现/spawn服务后，创建一个服务客户端，连接名为/spawn的服务
    ros::service::waitForService("/show_person");
    ros::ServiceClient person_client = node.serviceClient<learning_communication::PersonSrv>("/show_person");

    // 初始化learning_communication::Person的请求数据
    learning_communication::PersonSrv srv;
    srv.request.name = "Tom";
    srv.request.age = 20;
    srv.request.sex = learning_communication::PersonSrv::Request::male;

    // 请求服务调用
    ROS_INFO("Call service to show person[name:%s, age:%d, sex:%d]",
            srv.request.name.c_str(), srv.request.age, srv.request.sex);

    person_client.call(srv);

    // 显示服务调用结果
    ROS_INFO("Show person result : %s", srv.response.result.c_str());

    return 0;
};
```

person_client.cpp

如何实现一个客户端

- 初始化ROS节点；
- 创建一个Client实例；
- 发布服务请求数据；
- 等待Server处理之后的应答结果。

3. ROS Service通信编程

```
## Declare a C++ executable
## With catkin_make all packages are built within a single CMake context
## The recommended prefix ensures that target names across packages don't collide
# add_executable(${PROJECT_NAME}_node src/learning_communication_node.cpp)

## Specify libraries to link a library or executable target against
# target_link_libraries(${PROJECT_NAME}_node
#   ${catkin_LIBRARIES}
# )

## Add cmake target dependencies of the executable
## same as for the library above
# add_dependencies(${PROJECT_NAME}_node ${${PROJECT_NAME}_EXPORTED_TARGETS} ${catkin_EXPORTED_TARGETS})

add_executable(person_server src/person_server.cpp)
target_link_libraries(person_server ${catkin_LIBRARIES})
add_dependencies(person_server ${PROJECT_NAME}_gencpp)

add_executable(person_client src/person_client.cpp)
target_link_libraries(person_client ${catkin_LIBRARIES})
add_dependencies(person_client ${PROJECT_NAME}_gencpp)
```

如何配置CMakeLists.txt中的编译规则

- 设置需要编译的代码和生成的可执行文件；
- 设置链接库；
- 添加依赖项。

```
add_executable(person_server src/person_server.cpp)
target_link_libraries(person_server ${catkin_LIBRARIES})
add_dependencies(person_server ${PROJECT_NAME}_gencpp)

add_executable(person_client src/person_client.cpp)
target_link_libraries(person_client ${catkin_LIBRARIES})
add_dependencies(person_client ${PROJECT_NAME}_gencpp)
```

3. ROS Service通信编程

```
$ cd ~/catkin_ws
```

```
$ catkin_make
```

```
$ source devel/setup.bash
```

```
$ roscore
```

```
$ rosrun learning_communication person_server
```

```
$ rosrun learning_communication person_client
```

```
hcx@hcx-vpc:~/catkin_ws$ rosrun learning_service person_server
[ INFO] [1562234385.473929292]: Ready to show person informtion.
[ INFO] [1562234405.584154235]: Person: name:Tom age:20 sex:1
[ INFO] [1562234411.809871741]: Person: name:Tom age:20 sex:1
```

```
hcx@hcx-vpc:~/catkin_ws$ rosrun learning_service person_client
[ INFO] [1562234405.582071660]: Call service to show person[name:Tom, age:20, sex:1]
[ INFO] [1562234405.584514656]: Show person result : OK
hcx@hcx-vpc:~/catkin_ws$ rosrun learning_service person_client
[ INFO] [1562234411.808122249]: Call service to show person[name:Tom, age:20, sex:1]
[ INFO] [1562234411.810180819]: Show person result : OK
```

ROS项目开发流程

工作空间 → 功能包 → 源代码 → 编译 → 运行

ROS Topic通信编程

发布者Publisher、订阅者Subscriber的创建
自定义话题消息、编译规则的设置与运行

ROS Service通信编程

服务器Server、客户端Client的创建
自定义请求/应答数据、编译规则的设置与运行

使用海龟仿真器，完成以下编程作业：

1. 创建一个节点，在其中实现一个订阅者和一个发布者，完成以下功能：

- 发布者：发布海龟速度指令，让海龟圆周运动
- 订阅者：订阅海龟的位置信息，并在终端中周期打印输出

2. 创建另外一个节点，在其中实现一个客户端，完成以下功能：

- 客户端：请求海龟诞生的服务，在仿真器中产生一只新的海龟

3. 综合运用话题与服务编程、命令行使用，实现以下场景：

小R想要实现一个海龟运动控制的功能包，需要具备以下功能（[以下指令的接收方均为该功能包中的节点](#)）：

- 通过命令行发送新生海龟的名字，即可在界面中产生一只海龟，并且位置不重叠；
- 通过命令行发送指令控制界面中任意海龟圆周运动的启动/停止，速度可通过命令行控制；

你可以帮助小R实现这个功能包么？
